## NOTES

- All values at reference temperature of 23°C (73°F) unless stated otherwise.
- Relay may pull in with less than "Must Operate" value.
- "Max. Continuous Voltage" is the maximum voltage the coil can endure for a short period of time.
- Coil suppression circuits such as diodes, etc. in parallel to the coil will lengthen the release time.
- Relay adjustment may be affected if excessive shock is applied to the relay.
- Relay adjustment may be affected if undue pressure is exerted on the relay case.
- Specifications subject to change without notice.
- For automated dual wave soldering process we recommend preheating with 120°C (248°F) for max. 120 seconds (including ramp time) and a soldering temperature of 270  $\pm 5$ °C (500  $\pm 9$ °F) for max. 10 seconds soldering time (5 seconds per wave) in accordance to annex N of IEC61810-1 and the IEC 61760-1 profile for wave soldering. For manual soldering we recommend 350°C (662°F) max. temperature for max. 5 seconds. During the soldering process, no force may be exerted on the relay terminals.
- Non-sealed relays must not be washed, immersion cleaned or conformal coated as substances may enter the case and cause corrosion or seizure of mechanical parts.
- With sealed versions of this relay type, the auxiliary vent hole should be cut open after washing or conformal coating to achieve the specified performance and service life. Care must be taken to ensure no particles get into the relay as a result of the cutting process.
- If washing a sealed relay, temperature of washing liquid and surface handling cleanser should be controlled below 40°C and within 10°C of component temperature. Limit pressure wash to 1.5 bar max and cleaning time to 2 minutes. A water rinse is recommended to remove cleaning agents. Never use ultrasonic wash.
